

Top: Wrapped interferogram for the period 19.08.2003 - 14.02.2006 of the Garmsar area showing surface displacements fringes over most of the Garmsar salt nappe and its surroundings. Speckled areas are where the phases are incoherent over the whole epoch. Bottom: The above interferogram flattened. White areas represent incoherent interference between equivalent pixels on image pairs. The colours refer to surface displacement in the LOS as shown in the key.
